What's Inside

- 4 forecasting models benchmarked against 2 naive baselines (SARIMA, Prophet w/ holidays, XGBoost, weighted Ensemble)
- SHAP explainability + model-agnostic conformal prediction intervals (distribution-free uncertainty bounds)
- Dual-method anomaly detection AND K-Means clustering applied to both products and customers (RFM)
- Monte Carlo inventory cost simulator (newsvendor-style) + an A/B testing lab with power analysis
- Auto-generated executive briefing with one-click PDF export, live from the current data
